

ABSTRACT

A molding for immobilizing a cloth, cover or similar object in the groove of a supporting structure comprises a core from which at least two elastically deformable wings are extended. The wings are essentially parallel to each other and remote from each other with the aid of a reinforcing resource characterized as at least one arched cross-member extending between the two wings and connecting the ends of the wings located away from the core. The molding also includes an end stop intended to limit the movement of the cross-member.
